

HEDIS[®] Measures for Diabetic Patient Health

In 2022, the HEDIS[®] Comprehensive Diabetes Care measure was separated into three standalone measures. All diabetes care measures are used for HEDIS reporting to drive improvements in patient health.

The standalone measures include:

- [Hemoglobin A1c Control for Patients with Diabetes \(HBD\)](#)
- [Eye Exam for Patients with Diabetes \(EED\)](#)
- [Kidney Health Evaluation for Patients with Diabetes \(KED\)](#)

Patients with diabetes require consistent medical care and monitoring to reduce the risk of severe complications and improve health outcomes. Interventions to improve diabetes outcomes go beyond glycemic control. That is why the comprehensive diabetes care composite measure has been split to enable more focus of the components of diabetes care.

View the tip sheets to learn more about what is included in the measures and ways you can close gaps in care for patients with diabetes. The tip sheets also cover required medical record documentation and claims coding to reduce the need for medical record reviews.
